# Conexión al modelo

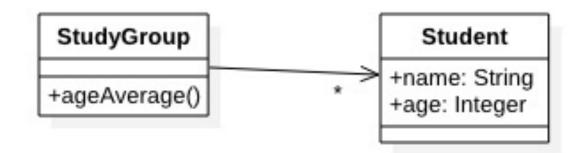

Un modelo, muchas sesiones ...

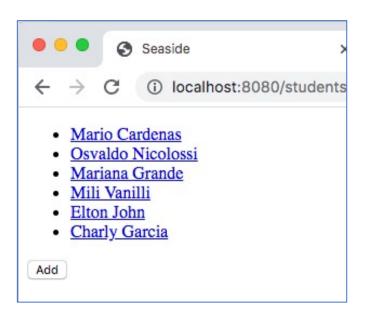

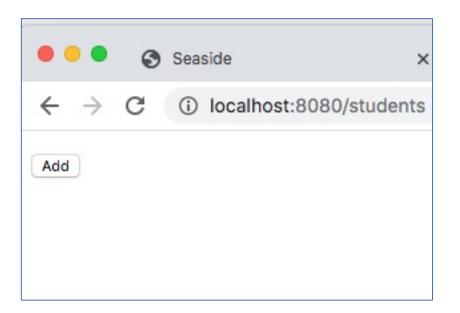

### Listar, agregar, mostrar/editar ...

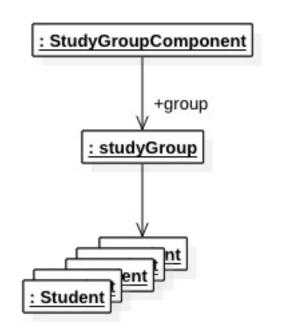

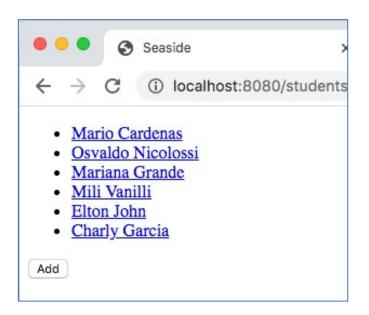

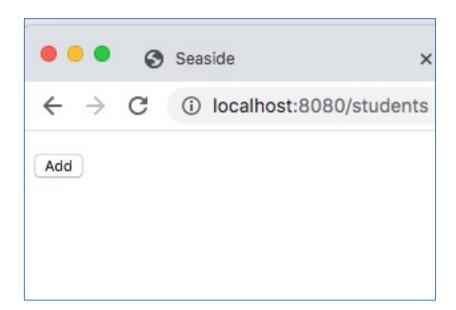

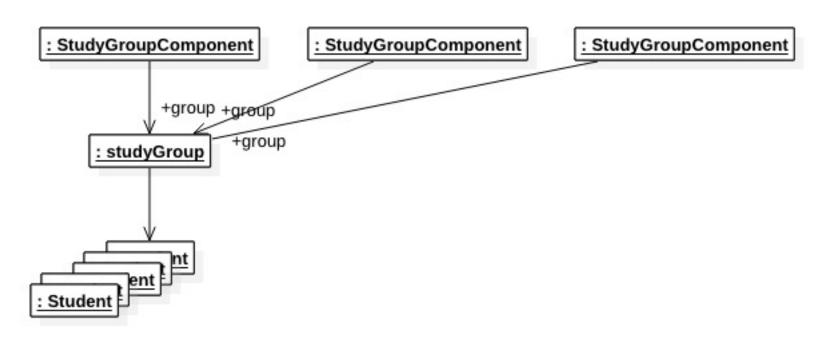

## Una sola instancia de StudyGroup para todos...

- Vamos a "hackear" la clase StudyGroup para que cuando alguien le pide una instancia, devuelva siempre la misma
- Para no romper el new, vamos a definir un nuevo mensaje de clase (#soleInstance)
- Vamos a definirle una variable a la clase (la clase, como es un objeto, tiene sus propios métodos y variables) para que guarde la instancia que devuelve.

#### StudyGroup

+soleInstance: StudyGroup

+soleInstance(): StudyGroup

+clearSoleInstance()

+addStudent(aStudent)

+students(): Student[\*]

+ageAverage(): Float

### Variable de instancia de clase

```
StudyGroupComponent class 
instanceVariableNames: 'soleInstance'
```

#### Inicialización haragana

### soleInstance

```
^ soleInstance ifNil: [ soleInstance := self new ]
```

#### clearSoleInstance

```
soleInstance := nil
```
